Statement

As an environmentalist, I want to be able to purchase information about the recycling information of an area to figure out how much are things recycled rather than trashed.

Background

A one-time payment for basic data allows third parties to pay and obtain data from a certain time frame rather than a subscription. This allows them to find out which company should be approached to improve their recycling footprint.

Requirements

Functional Requirements:

- The system should continuously collect data from cameras within the recycling facility, including information on different types of recyclable items (e.g., cans, milk jugs, bottles) and specific product brands (e.g., Coca Cola, Mountain Dew).
- All collected data should be securely stored with appropriate metadata, including timestamps, locations, and item identifications.
- The system should segment the collected data into specific time frames, making it available for purchase as historical data.
- The system should provide a secure and controlled access mechanism for third-party users to purchase specific data sets.
- Third-party users should be able to make one-time payments to access data from a certain time frame, without the need for a subscription.
- The system should allow users to retrieve the purchased data in a structured format for analysis.
- The system should provide documentation and tools to assist users in analyzing the recycling data and drawing insights.

Non-Functional Requirements:

- Data should be stored and transferred securely to protect the privacy of individuals and the integrity of the data.
- The system should be able to handle a growing amount of data and user requests as more recycling facilities are equipped with ML-based cameras.
- Data retrieval should be responsive, and the system should efficiently process payment transactions.
- The ML-based cameras should have high accuracy in identifying recyclable items and product brands.

- The system should comply with relevant data protection and privacy regulations.

Open Questions

- How will the system ensure that individuals' privacy is protected while collecting and providing access to this data?
- What is the data retention policy? How long should historical data be available for purchase?
- In what format will the data be provided to third-party users for analysis?
- What payment gateway or method will be used to facilitate one-time payments for data access?
- How will access to the data be controlled to prevent unauthorized use or sharing?

Acceptance Criteria:

- Third-party users can make one-time payments for access to recycling data from a specific time frame.
- The system securely stores and segments the collected data.
- Users can retrieve purchased data in a user-friendly and structured format.
- The system provides support for data analysis through documentation and tools.
- Data accuracy meets or exceeds defined standards.

Definition of Done:

- The system is operational and collecting data from the recycling facility's cameras.
- Payment processing is integrated and functional.
- Data access controls and security measures are in place.
- Documentation for users and third-party companies is available.
- Compliance with data protection regulations is verified.
- Data accuracy is tested and validated.

Note: This is a rough draft of a user story and it is bound to change and be more detailed.
